

Assignment 2: Phase imaging

Task 1. Impact of the phase component

Based on 2 selected images investigate the impact of the phase component on image reconstruction

where the phase component has to be replaced according to the model:

$$\Phi(\cdot) = (1-a)\Phi_{im1}(\cdot) + a\Phi_{im2}(\cdot), \quad a=0:0.25:1$$

To complete all results (report together with your code) into archive and submit it to Computational imaging course moodle.
